                                                                                                                                                                                                                                                                                                                                                                                                   Op
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                  This human cDNA sequence includes a coding region for GPBB (see AAMB5474), an BB kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which cats as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GPBB expression or action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Antagonists to GPBB are used to raise specific antibodies (used as antagonists, GPBB are used to raise specific antibodies (used as antagonists, as diagnostic reagents and for delivering toxins or other compounds to GPBB-expressing cells) and to screen for antibodies. Antisense oligonucleotides can also be used as antagonists.

Methods are provided for diagnosing disease, or determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                        Composition containing antagonist of growth factor GPB8 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GPB8 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    susceptibility to disease, resulting from altered GP88 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the Full-length cDNAs

Claim 1; SEQ ID 3976; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonuclectide comprises a least 15 nucleotides; or (c) a combination of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence of sequence 3'-end sequence 3'-end sequence 1'-end detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to the present invention

Sequence 757 BP; 139 A; 232 C; 217 G; 165 T; 4 other;

WPI; 2001-318749/34.

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the Full-length cDNAs

Claim 8; SEQ ID 15309; 2537pp + CD ROM; English.

the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification The present invention describes primer sets for synthesising 5602 [411].length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5. end the full length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to the present invention

ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bloactivity. In contrast, however, ET-2 is apparently not capable of ellotting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity.

                                                                                                                                                                                                  ET-1 and ET-2 were isolated from rat kidneys and their amino acid sequences determined. A full length rat ET cDNA (AAQ14338) was obtd. by screening a rat kidney cDNA library in lambda gill with PCR generated ET probes. These probes were also used to obtain the mouse ET gene (AAQ14340) from a mouse T-cell genomic library ET DNA was also obtained from human sources (AAQ14339). An anti-sense ribonucleic acid molecule complementary to the indicated fragment in the features is also claimed
                                                                                                                                               Gaps

The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiasthmatic; antinheumatic; antiarthritic; antilnflammatory; antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coaquiant; nootropic; vasotropic; antipsoriatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         dermatological; neuroprotective; thrombolytic; coagulant; noctropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection;

Two members of the epithelin family, EP-1 and EP-2, have been purified from natural sources, and cDNAs encoding these and several other members of the epithelin family have been isolated from rat (AAQ14338), human (AAQ14339), bovine, murine (AAQ14340) and chicken (AAQ14338), human (AAQ14339), bovine, murine ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitors bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and,

ET-1 and ET-2 were isolated from rat kidneys and their amino acid sequences determined. A full length rat ET cDNA (AAQ14318) was obtd. by screening a rat kidney cDNA library in lambda gil0 with PCR c generated ET probes. These probes were also used to obtain the mouse ET gene (AAQ14340) from a mouse T-cell genomic library. ET DNA was also obtained from human sources (AAQ14339).

ET DNA was also obtained from human sources (AAQ14339).

ET an anti-sense ribonucleic acid molecule complementary to the indicated fragment in the features is also claimed.

ET-1 is a bifunctional growth requiator, capable of stimulating the growth of some cell types while inhibiting the growth of others. C ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, c in fact, antagonises this ET-1 activity.

This murine cDNA sequence includes a coding region for GPBB (see AAWB5474), an 88 kDa glycoprotein autocrine growth factor and compiling formula processed and unregulated regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which carts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GPBB expression or action in the tumorigenic cells results in an inhibition of the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Murine GPBB cDNA was isolated from the highly tumorigenic PC cell line CDNA library using a probe obtained by PCR using primers based on isolated GPBB peptides. Antagonists to GPBB are used to treat diseases associated with increased expression of GPBB, particularly cancer but also viral infections. Fragments of GPBB are used to raise specific antibodies (used as antagonists, as diagnostic reagents and for delivering toxins or other compounds to GPBB expressing cells) and to screen for antibodies. Antisense oligonucleotides can also be used as antagonists. Matchods are provided for delivering toxins or other compounds to disease, or determining susceptibility to disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GP88 expression
                                                                                                                                         GP88; granulin; epithilin; mouse; growth factor; autocrine; tumour; cancer; viral infection; antagonist; therapy; diagnosis; ss.

sequences determined. A full length rat ET CDNA was obtd. by screening a rat kidney CDNA library in lambda gill with PCR generated ET probes. These probes were also used to obtain the mouse ET gene (AAQ14340) from a mouse T-cell genomic library. ET DNA was also obtained from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An anti-sense ribonucleic acid molecule complementary to the indicated fragment in the features is also claimed.

ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others.

ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity.

```
nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 414 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -
                                                                                                                                                                             Human; microarray; single exon probe; gene expression; breast;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 423;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; SEQ ID NO 3676; 327pp + sequence listing; English.
                                                                                                                                  Human breast cell single exon nucleic acid probe #3676.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WIPO at ftp.wipo.int/pub/published_pct_sequences

                                      The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                        Single exon nucleic acid probes for analyzing gene expression in human

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple scherosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

WARNING: There is evidence that suggests that the 384-well parent
plate of this clone contains both human and mouse derived clones.
Thus, the origin of this clone is uncertain. This caution should kept in mind should you use this clone.

/tissue_trpe="repithelioid carcinoma cell line"
/lab_host="Publib (phage-resistant)"
/note="Organ: pancreas; Vector: pOTB7; Site_1: XhoI;
Site_2: EcoRI; cDNA made by oligo-dT priming.
Directionally cloned into EcoRI/XhoI sites using the following 5' adaptor: GGACGAG(G). Size-selected >500bp following 5' adaptor: GGACGAG(G). Library constructed by Ling for average insert size 1.8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library. |"

Anote-"Organ: pooled lung and spleen; Vector: pCMV-SPORT6; Site_1: Not1; Site_2: EcoRV (destroyed); RNA source anonymous pool of 24 week female lung, 16 week female spleen, and 20-22 week male spleens. Library is oligo-dr primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.4 kb, insert size range 1-3 kb. Library is normalized and enriched for full-length clones and was constructed by C Gruber (Invitrogen). Research Genetics tracking code 026. Note: this is a NIH,MGC Library."
